

Verrutop is used for treatment of external genital warts. It is a solution containing a mixture of acids and salts which are applied topically to the wart lesions causing destruction of the wart tissue. You might need up to 4 applications of Verrutop to get rid of the warts.

Verrutop®

- Shortly after application you may notice a slight burning or itching around the area. This will usually pass within an hour
- Do not rub or scratch the area. If you do, wash your hands with plenty of water and do not rub your eyes
- You may also notice that the wart changes colour very quickly, to white or yellow. Over a few days it could change to black
- You can wash and shower as normal but avoid long hot soaks in the bath

Over the next few days:

VT-222010-SH04

- **Remember that the wart may still be infectious so it is important to always use a condom.** Verrutop takes a little time to fully penetrate the skin so wait at least 24 hours before using a condom to minimise the risk of condom damage.
- In some cases the wart can detach from the skin before 15 days, leaving normal skin underneath
- Usually a number of treatments are required so it is important to keep the appointments set by your Healthcare Professional

Even if your wart has detached since your last appointment it is important that you attend clinic to confirm full healing
